Great visit at Riverview Mod Wash. Today I delivered chemistry, consolidated containers, took inventory count for CPC reporting, and performed a tunnel audit. First thing I noticed when I walked in the equipment room was blue triple foam had been spilt around the lid of its container and on the floor under the container. I found multiple container caps on the floor and it appeared that someone tried to poke holes in them as if they were having trouble opening them. When tunnel was clear, I disconnected the water line from one of the chemical boards and used it to spray the floor to clean up the mess the best I could. I also rinsed the top of the container and wiped down with a towel.

During my tunnel audit, I noticed passenger side tri foam (yellow) was not foaming and was spitting. I checked air pressure and it was set to 12psi. Tried replacing injector and issue continued. I then removed the versa dial filter and replaced it with a new one and problem was solved. The screen inside filter was clogged and not allowing proper chemical to pass. Yellow now has great triple foam action. All foamer inserts are in good shape and rainbars are all clear. There is a possible leak somewhere in the chase pipe for the bug prep station. The 2 inch pipe is filled with water. There is salt on the floor in the equipment room near softener. Either Brine tank has crack or salt was spilled on the floor. Equipment room needs a good cleaning. Other than that, site is clean and orderly. Vehicles are coming out clean, dry, and shiny.
